

A random, unfiltered sample of replicated switch calls

12 genes drawn uniformly at random (seed 20260906) from the 5,361 genes in the replicated set. Nothing was filtered: genes with three or more sites, sites far apart, and small effects are all kept. Mouse 1 coverage; every site shown replicated in both mice.

Ticks mark every replicated site. Green, usage rises with differentiation; orange, usage falls. Tracks share one scale within a gene (printed at its top right) and are binned to the panel width, so a wide locus is drawn at lower resolution, not truncated.
