

a How far apart are the switching sites?

Distance between the outermost switching sites in a gene (bp)

3,683 genes with more than one replicated site.
A tandem 3'UTR switch happens inside one 3'UTR, so the mass beyond 10 kb is unlikely to be one.

b Does a call sit at a real transcript end?

Read depth inside the transcript $\div$ outside, at the call

293 replicated sites sampled at random. No atlas is used here, yet 68.9% land at a sharp 3' end, against the 0.706 atlas agreement the paper reports.
