

a Cell-type poly(A) switches in a lung-adenocarcinoma cohort

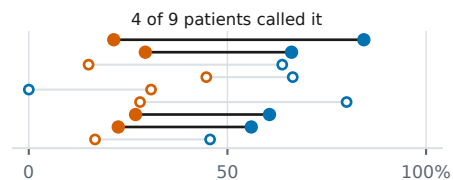

Left, mean read depth per cell pooled over the patients the gene was tested in. Right, every one of those patients separately.

Pooled coverage

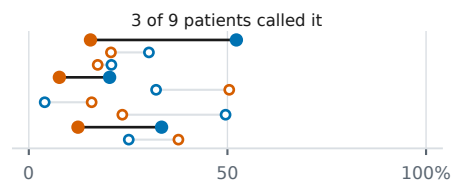

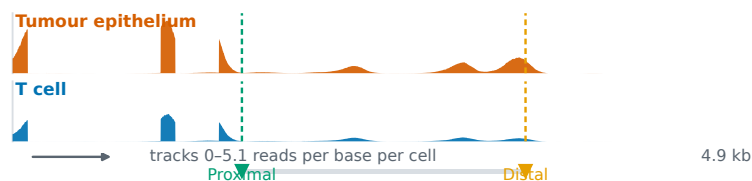

ZBTB38 chr3 (+), distal-up in tumour

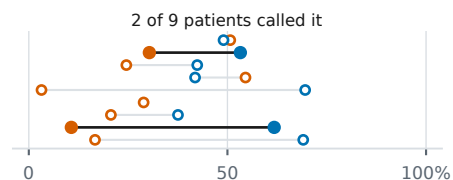

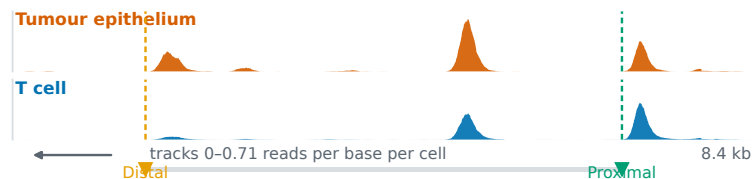

Proximal-site usage, per patient

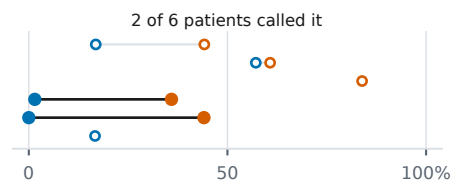

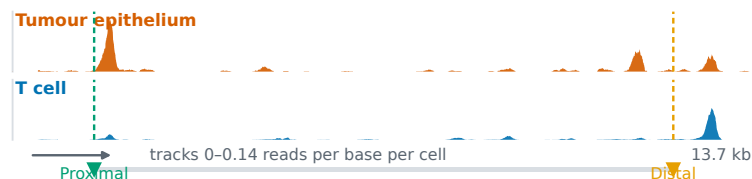

YWHAB chr20 (+), distal-up in tumour

CGGBP1 chr3 (-), distal-up in tumour

SPAG1 chr8 (+), proximal-up in tumour

Filled markers, patients that called the switch ($q < 0.05$); open markers, patients that tested the site without calling it.

A tested-but-not-called patient is not a disagreement under the replication rule, so the two are drawn apart.
