

Atlas-independent validation of the pbmc\_10k\_v3 head-to-head against PacBio Kinnex single-cell long reads

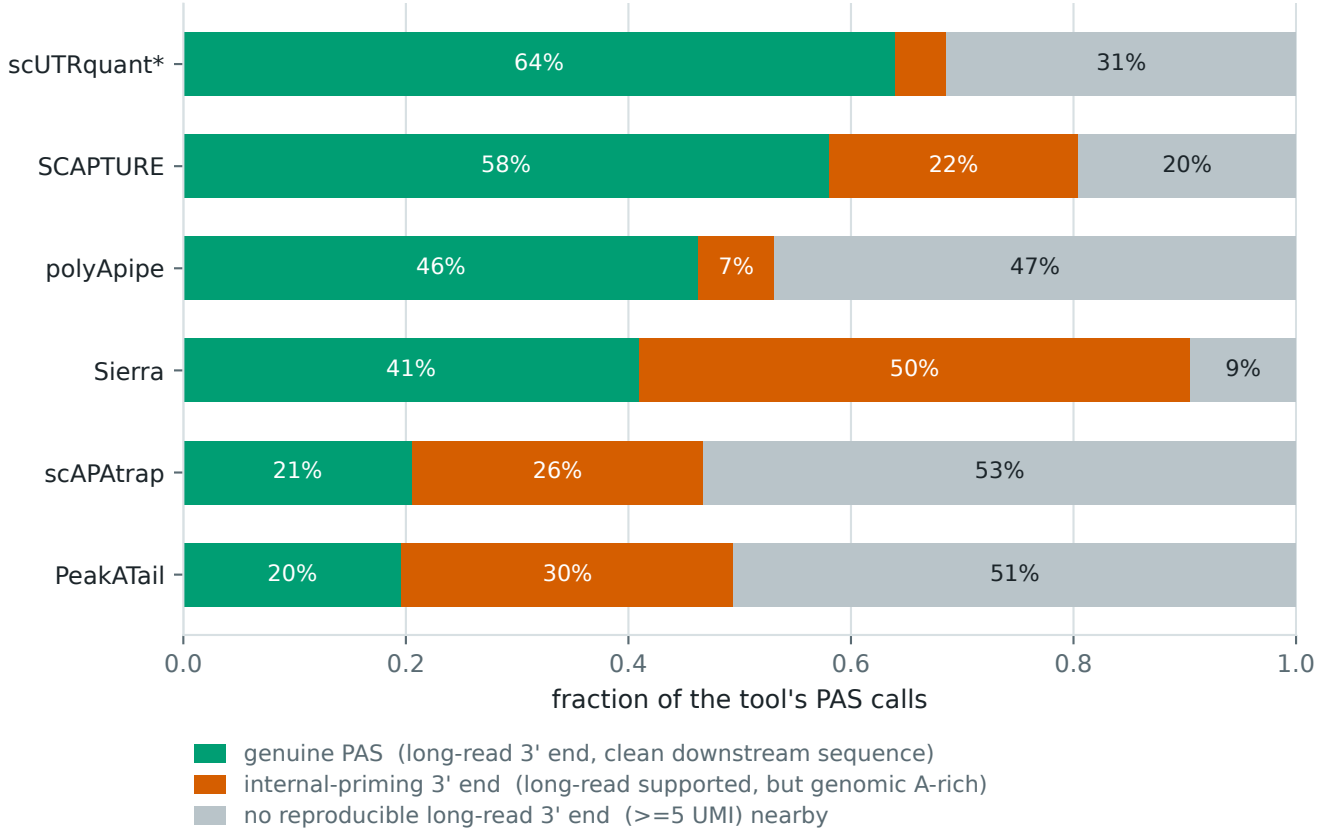

A The truth set is real, but its support threshold is depth-dependent

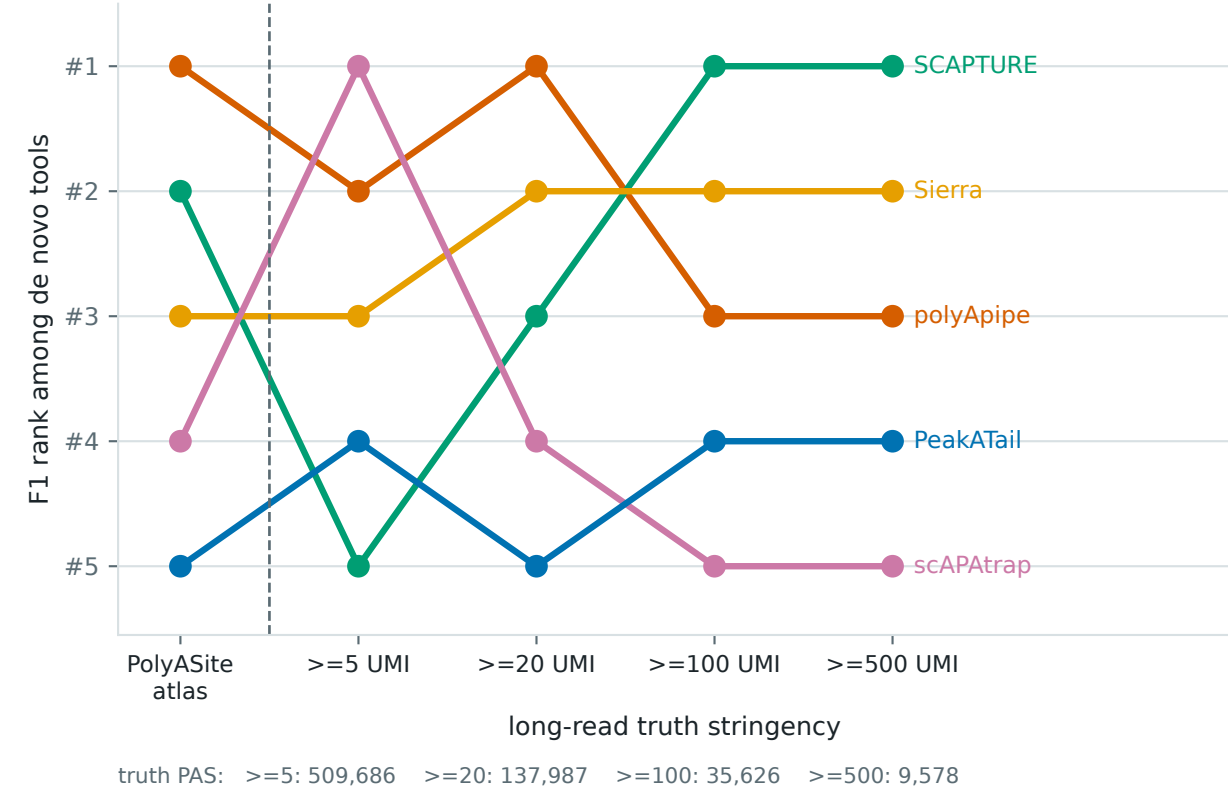

B Precision ordering replicates (de novo Spearman rho = 0.90)

C What each tool's calls actually sit on (100 bp, strand-matched)

D The F1 ranking does NOT survive; only PeakATail's position does

CAVEAT The Kinnex donor is NOT the pbmc\_10k\_v3 donor and the 10x chemistries differ (Kinnex GEM-X 3' v4 vs pbmc\_10k\_v3 3' v3): this is SITE-LEVEL truth and validates PAS POSITIONS, not per-cell usage. Truth = 104.0 M dedup FLNC molecules (isoseq refine --require-polya), real-cell CB, 3' softclip <=30 nt, internal priming = >=12 A or >=6 consecutive A in the 18 nt downstream, greedy +/-25 nt peak calling. F1 compares a fixed call set against truth sets that differ 53-fold in size, so it is not a stable ranking statistic here; precision and recall (panel B) are. scUTRquant\* is annotation-based (fixed catalog) and is shown but not ranked with de novo tools.
